HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Micromorphological analysis of roman roads functioning: Evidence of rhythms of human trampling and vehicle traffic (Northeast of France)

World Archeological Congress 2016

T10-D: Science in archaeology / New contributions to geoarchaeology

Marie-Caroline CHARBONNIER^{1,3}, Cécilia CAMMAS^{1,2,3} (1)Inrap, (2)UMR 5140 Archaeology of the Mediterranean Societies (3) Unit of Micromorphology Inrap / AgroParisTech

Introduction & Objectives

Roads & Streets

 \Rightarrow Elements that structure town planning \Rightarrow Installation, organization, shifting & persistence related to urban dynamic

Archeological questions

- \Rightarrow Construction / refections techniques ?
- \Rightarrow Identification / location of circulation surfaces?
- \Rightarrow Status of the streets & roads ?

Antonin Route (Romar

and early medieval)

Current studies focus on:

 \Rightarrow The routes and the pattern of the street / roads in urban / rural context (based on historic documents & maps, archaeological sites map)

Lack of studies on:

 \Rightarrow The sedimentary expression of traffic: typical street improvements, trampled layers or layers related to vehicle traffic

Our objectives are:

- To identify & characterize roads / streets from the field to the microscopic scale
 - Intensity / Frequency of trampling or traffic
 - Typical pattern of layers & spatial organisation of circulation areas
- To specify the anthropogenic activities and the function of these areas

Material & Methods

Roads sections in different contexts (rescue archaeology)

Method: Stratigraphic analysis from the field to microscopic scale

Results: Diagnostics features of environmental conditions, trampling & passage of vehicles

Features related to local conditions > Degree of wetness / water logging

ron impregnations

Human trampling

Passage of vehicles

uency

Components related to human activities in the surroundings areas > Multi activities or areas reserved to traffic

Rocks, ceramic, bones, bricks & tiles...

Bone fragment

Results: Selected types of functioning

Wheel tracks on scraped soil (Sains-du-Nord)

Superimposed non constructed circulation areas: Fine surfaces of circulation - Iron crusts (Famars)

Thick & compacted traffic layer (Bezannes)

Ditches on each side of the road: Functioning of the left one

Fragment of seed

Ditch filling: Washed & clay silt intercalations, clay silt coatings, sedimentary crust Action of water (runoff, decantation)

Few anthropogenic components

Broken components in the wheel tracks

tampering & compaction

Conclusions

Field work + micromorphological analysis provide useful informations about the nature of the traffic layers and their formation processes. It shed a new light on these layers, and shows that they should not be considerered as one massive deposit or superimposition of backfills but should be investigated with the same geoarchaeological methods and the same care as others archaeological layers.
